

PROJECT REPORT

Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

1. INTRODUCTION

1.1 Project Overview

The project focuses on automating the procurement and configuration workflow for standard laptop orders using ServiceNow Flow Designer. The workflow is intended to reduce manual intervention, improve task allocation, and ensure laptops are configured promptly after arrival.

1.2 Purpose

The purpose is to streamline standard laptop ordering by automatically generating and assigning configuration tasks to the Hardware team after the service request is approved.

2. IDEATION PHASE

2.1 Problem Statement

The current IT procurement process lacks efficiency and automation, causing delays and manual overhead. Standard laptop requests often require configuration, but this step can be overlooked or delayed, creating user wait time and inefficient resource allocation.

2.2 Empathy Map Canvas

Not provided in the source PDF. The source describes user frustration caused by configuration delays and the need for a more streamlined procurement experience.

2.3 Brainstorming

The source solution centers on using ServiceNow Flow Designer to automate creation and assignment of catalog tasks for standard laptop configuration.

3. REQUIREMENT ANALYSIS

3.1 Customer Journey map

Source-supported journey: place a Standard Laptop request → request approval → requested item is processed → catalog task is generated → task is assigned to Hardware → configuration status can be reviewed.

3.2 Solution Requirement

The solution requires a ServiceNow Flow named "Standard laptop task," a Service Catalog trigger, a Create Catalog Task action, assignment to the Hardware group, an Approved approval condition, and association of the flow with the Standard Laptop catalog item.

3.3 Data Flow Diagram

Not provided as a diagram in the source PDF. The documented process flow is: Service Catalog request → approval → Flow Designer trigger → Create Catalog Task → Hardware assignment → catalog task status.

3.4 Technology Stack

ServiceNow and ServiceNow Flow Designer are the technologies explicitly identified in the source material.

4. PROJECT DESIGN

4.1 Problem Solution Fit

The automated workflow directly addresses the documented problem of manual overhead and delays by creating the configuration task automatically after approval.

4.2 Proposed Solution

Create and activate a Flow Designer flow named “Standard laptop task,” triggered by Service Catalog activity. The flow creates a Catalog Task with the description “Laptop need to Configured,” assigns it to Hardware, and requires Approval = Approved. The flow is then assigned to the Standard Laptop service catalog item.

4.3 Solution Architecture

The documented architecture is a ServiceNow Service Catalog → Flow Designer trigger/action → Catalog Task → Hardware assignment workflow. A separate architecture diagram was not supplied in the source PDF.

5. PROJECT PLANNING & SCHEDULING

5.1 Project Planning

Milestone 1 – Flow: create, configure, trigger, save, and activate the Standard laptop task flow. Milestone 2 – Flow assignment: associate the flow with the Standard Laptop service catalog item. Milestone 3 – Service Catalog: place an order, review approval, open the requested item, and verify the generated catalog task and assigned group.

6. FUNCTIONAL AND PERFORMANCE TESTING

6.1 Performance Testing

The source PDF documents functional verification steps but does not provide quantitative performance test results. Verification includes checking the order status, approval, requested item, and catalog task status, short description, and assignment group.

7. RESULTS

7.1 Output Screenshots

The source PDF refers to ServiceNow screens and records but the extracted source content does not provide reusable screenshot images. The documented expected result is an updated Catalog Task showing the configured short description and Hardware assignment.

8. ADVANTAGES & DISADVANTAGES

Advantages: reduced manual intervention; fewer potential procurement errors; timely laptop configuration; improved task allocation; reduced user wait times; improved IT procurement productivity and user experience.

Disadvantages/limitations: the source PDF does not explicitly document disadvantages. No unsupported disadvantages have been added.

9. CONCLUSION

By automating standard laptop procurement with ServiceNow Flow Designer, the project addresses inefficiencies and reduces manual overhead. The workflow supports timely configuration, minimizes user wait times, improves resource allocation, and provides a more seamless procurement process.

10. FUTURE SCOPE

The source PDF does not specify future-scope items. No additional future capabilities have been inferred.

11. APPENDIX

Source Code (if any)

Not provided in the source PDF.

Dataset Link

Not provided in the source PDF.

GitHub & Project Demo Link

Not provided in the source PDF.
